

Comparing Rational and Irrational Numbers

Fill in the blanks:

1. The number $\sqrt{36}$ is rational, while $\sqrt{37}$ is irrational.
2. $0.333\ldots$ is a rational number, but π is an irrational number.
3. $\sqrt{50}$ lies between the integers 7 and 8.
4. $5/4$ expressed as a decimal is 1.25.
5. $\sqrt{2} \approx 1.414$ and 1.42 ; between these, the larger number is 1.42.
6. To compare rational and irrational numbers, we usually convert them into decimal form.
7. $\sqrt{121}$ is exactly 11, but $\sqrt{122}$ is approximately 11.045.
8. On a number line, $\sqrt{10}$ (≈ 3.162) lies between 3 and 4.
9. A terminating decimal like 2.75 is always rational.
10. $\sqrt{5}$ (≈ 2.236) is greater than 2.2 but less than 2.3 .

WORD BANK: Greater, 11.045, Rational, 1.25, Irrational, 3 and 4, Decimal, Irrational, 1.42, 7 and 8, Rational, 11, Less
