Introduction to Irrational Numbers

State T for True and F for False

1. $\sqrt{2}$ is an irrational number. T

2. π is a terminating decimal. F

3. All non-terminating, non-repeating decimals represent irrational numbers. T

4. $0.(1212\dots)$ is irrational. F

5. $\sqrt{9} = 3$ is irrational. F

6. $22/7$ is an exact value of π . F

7. The decimal expansion of an irrational number neither terminates nor repeats. T

8. e (Euler's number) $\approx 2.718\dots$ is irrational. T

9. 3.14159265 is a rational approximation of π .

T

10. $\sqrt{5}$ has a repeating decimal expansion. F
